Introduction

This notebook has the function implementations for manipulating objects with head `RSparseMatrix` that behave like `SparseArray` objects but have the added functionalities to use row names and column names in a manner similar to that of the sparse arrays objects from the base library `Matrix` [2] for the programming language R [1].

The idea is fairly simple: we can use associations or replacement rules to map row names and column names into integers. Similarly to how it is done in R, `RSparseMatrix` handles only strings as row names and column names.

Note that the package does not use `RLink` -- it has purely *Mathematica* language implementations.

The following function signatures are implemented:

```
RowNames[_RSparseMatrix]
ColumnNames[_RSparseMatrix]
SetRowNames[_RSparseMatrix, {_String..}]
SetColumnNames[_RSparseMatrix, {_String..}]
DimensionNames[_RSparseMatrix]
Dimensions[_RSparseMatrix]
RowCount[_RSparseMatrix]
ColumnsCount[_RSparseMatrix]
RowSums[_RSparseMatrix]
ColumnSums[_RSparseMatrix]
Total[_RSparseMatrix, ___]
ArrayRules[_RSparseMatrix]
Transpose[_RSparseMatrix]
MatrixForm[_RSparseMatrix]
MatrixPlot[_RSparseMatrix]
Times[_RSparseMatrix, _RSparseMatrix]
Times[_ , _RSparseMatrix]
Times[_RSparseMatrix, _]
Plus[_RSparseMatrix, _RSparseMatrix]
Plus[_ , _RSparseMatrix]
Plus[_RSparseMatrix, _]
Dot[_RSparseMatrix, _RSparseMatrix]
Dot[_ , _RSparseMatrix]
```

```

Dot[_RSparseMatrix, _]
Part[_RSparseMatrix, _String | {_String ..}, ___]
Part[_RSparseMatrix, _, _String | {_String ..}]
Part[_RSparseMatrix, _String | {_String ..}, _String | {_String ..}]
RowBind[_RSparseMatrix, _RSparseMatrix]
ColumnBind[_RSparseMatrix, _RSparseMatrix]

```

Note that assignment (with `Set[___]`) is not implemented.

The package can be loaded from GitHub [3]:

```
In[244]:= Import["https://raw.githubusercontent.com/antononcube/MathematicaForPrediction/master/Misc/RSparseMatrix.m"]
```

```
In[181]:= Import["~/MathFiles/MathematicaForPrediction/Misc/RSparseMatrix.m"]
```

Exposition functions

```

In[2]:= Clear[ResultsGrid]
ResultsGrid[expressions_Inactive, opts___] :=
  Block[{t, t1},
    t = Map[HoldForm, expressions, {2}];
    t1 = ReleaseHold[Activate[t]];
    Grid[MapThread[Prepend,
      {{Activate[t], MatrixForm /@ t1, Head /@ t1}, Style[#, Blue, FontFamily -> "Times"] & /@ {"expr", "result", "head"}}], opts]
  ];

```

Tests and experiments

■ SparseArrays for comparisons

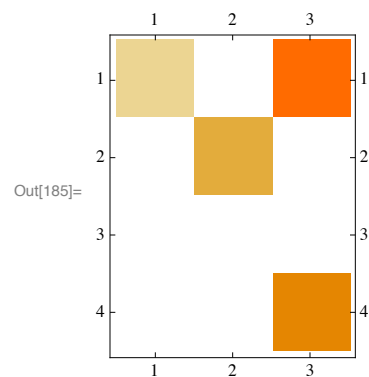

```

In[182]:= mat = SparseArray[{{1, 1} -> 1, {2, 2} -> 2, {4, 3} -> 3, {1, 4} -> 4, {3, 5} -> 2}];
MatrixPlot[mat]

```

```
In[184]:= mat2 = SparseArray[{{1, 1} → 1, {2, 2} → 2, {4, 3} → 3, {1, 3} → 4}];
MatrixPlot[mat2]
```

This illustrates row binding and column binding corresponding to R's function `cbind` and `rbind`. Here it is done over sparse arrays below it is done with `RSparseMatrix` objects.

```
In[186]:= Grid[{{MatrixForm[mat], MatrixForm[Join[mat, mat]], MatrixForm[Transpose@Join[Transpose[mat], Transpose[mat]]]}}
```

Out[186]=

$$\begin{pmatrix} 1 & 0 & 0 & 4 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 \\ 1 & 0 & 0 & 4 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 \\ 0 & 0 & 3 & 0 & 0 \end{pmatrix} \quad \begin{pmatrix} 1 & 0 & 0 & 4 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 3 & 0 & 0 \\ 1 & 0 & 0 & 4 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 \\ 0 & 0 & 3 & 0 & 0 \end{pmatrix}$$

■ Creation

```
In[187]:= rmat = MakeRSparseMatrix[{{1, 1} → 1, {2, 2} → 2, {3, 3} → 3, {1, 4} → 4},
  "ColumnNames" → {"a", "b", "c"}, "RowNames" → {"A", "B", "C"}, "DimensionNames" → {"U", "V"}]
```

```
Out[187]= $Failed
```

```
In[188]:= rmat = MakeRSparseMatrix[
  {{1, 1} → 1, {2, 2} → 2, {4, 3} → 3, {1, 4} → 4, {3, 5} → 2},
  "ColumnNames" → {"a", "b", "c", "d", "e"},
  "RowNames" → {"A", "B", "C", "D"},
  "DimensionNames" → {"U", "V"}]
```

```
Out[188]= SparseArray[ Specifiedelements 5
  Dimensions {4, 5}]
```

Note that the output is formatted to look like sparse array object. The package has this definition:

```
Format[RSparseMatrix[obj_]] := obj["sparseArray"];
```

The function `MatrixForm` shows the `RSparseMatrix` objects with their row and column names:

```
In[189]:= rmat // MatrixForm
```

```
Out[189]/MatrixForm=
```

$$\begin{pmatrix} & \begin{matrix} a & b & c & d & e \end{matrix} \\ \begin{matrix} A \\ B \\ C \\ D \end{matrix} & \begin{pmatrix} 1 & 0 & 0 & 4 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 \\ 0 & 0 & 3 & 0 & 0 \end{pmatrix} \end{pmatrix}$$

The `RSparseMatrix` objects can be created from `SparseArray` objects :

```
In[190]:= rmat = ToRSparseMatrix[SparseArray[rmat], "ColumnNames" → {"a", "b", "c", "d", "e"},
  "RowNames" → {"A", "B", "C", "D"}, "DimensionNames" → {"U", "V"}]
```

```
Out[190]= SparseArray[ Specifiedelements 5
  Dimensions {4, 5}]
```

```
In[191]:= rmat // MatrixForm
```

```
Out[191]/MatrixForm=
```

	a	b	c	d	e
A	1	0	0	4	0
B	0	2	0	0	0
C	0	0	0	0	2
D	0	0	3	0	0

■ Setting names

In[192]:= **rmat2 = rmat**

Out[192]= SparseArray[ Specified elements 5
Dimensions {4, 5}]

In[193]:= **MatrixForm[rmat2]**

Out[193]/MatrixForm=

	a	b	c	d	e
A	1	0	0	4	0
B	0	2	0	0	0
C	0	0	0	0	2
D	0	0	3	0	0

In[194]:= **SetRowNames[rmat2, ToString /@ Range[RowCount[rmat]]]**

Out[194]= SparseArray[ Specified elements 5
Dimensions {4, 5}]

In[195]:= **MatrixForm[rmat2]**

Out[195]/MatrixForm=

	a	b	c	d	e
1	1	0	0	4	0
2	0	2	0	0	0
3	0	0	0	0	2
4	0	0	3	0	0

In[196]:= **SetColumnNames[rmat2, ToString /@ Range[ColumnCount[rmat]]]**

Out[196]= SparseArray[ Specified elements 5
Dimensions {4, 5}]

In[197]:= **MatrixForm[rmat2]**

Out[197]/MatrixForm=

	1	2	3	4	5
1	1	0	0	4	0
2	0	2	0	0	0
3	0	0	0	0	2
4	0	0	3	0	0

```
In[198]:= MatrixForm[rmat]
```

```
Out[198]//MatrixForm=
```

	a	b	c	d	e
A	1	0	0	4	0
B	0	2	0	0	0
C	0	0	0	0	2
D	0	0	3	0	0

■ Query functions

These functions can be used to retrieve the names of rows, columns, and dimensions. They correspond to R's functions `rownames`, `colnames`, `dimnames`.

```
In[199]:= RowNames[rmat]
```

```
Out[199]= {A, B, C, D}
```

```
In[200]:= ColumnNames[rmat]
```

```
Out[200]= {a, b, c, d, e}
```

```
In[201]:= DimensionNames[rmat]
```

```
Out[201]= {U, V}
```

Functions that can be applied to sparse arrays follow.

```
In[202]:= Dimensions[rmat]
```

```
Out[202]= {4, 5}
```

```
In[203]:= ArrayRules[rmat]
```

```
Out[203]= {{1, 1} → 1, {1, 4} → 4, {2, 2} → 2, {3, 5} → 2, {4, 3} → 3, {_, _} → 0}
```

■ Visualization

The redefinitions of `MatrixForm` and `MatrixPlot` are very useful for visualizing the `RSparseMatrix` objects.

```
In[204]:= MatrixForm[rmat]
```

```
Out[204]//MatrixForm=
```

	a	b	c	d	e
A	1	0	0	4	0
B	0	2	0	0	0
C	0	0	0	0	2
D	0	0	3	0	0

```
In[205]:= MatrixPlot[rmat]
```

Here is another version of the `MatrixPlot` call that uses the row and column names as ticks.

```
In[206]:= MatrixPlot[rmat, FrameTicks → {{Transpose[{Range[RowCount[rmat]], RowNames[rmat]}], All},  
      {All, Transpose[{Range[ColumnCount[rmat]], ColumnNames[rmat]}]}}]
```

■ Transpose

```
In[207]:= MatrixForm[Transpose[rmat]]
```

```
Out[207]//MatrixForm=
```

	A	B	C	D
a	1	0	0	0
b	0	2	0	0
c	0	0	0	3
d	4	0	0	0
e	0	0	2	0

```
In[208]:= DimensionNames[Transpose[rmat]]
```

```
Out[208]= {V, U}
```

■ Sums

```
In[209]:= Total[rmat, 2]
```

```
Out[209]= 12
```

```
In[210]:= RowSums[rmat]
```

```
Out[210]= {1, 2, 3, 4, 2}
```

```
In[211]:= ColumnSums[rmat]
```

```
Out[211]= {5, 2, 2, 3}
```

■ Dot product

■ Matrix by vector

expr	rmat	Transpose[rmat[[{1}, All]]]	rmat.Transpose[rmat[[{1}, All]]]
Out[212]= result	$\begin{pmatrix} & a & b & c & d & e \\ A & 1 & 0 & 0 & 4 & 0 \\ B & 0 & 2 & 0 & 0 & 0 \\ C & 0 & 0 & 0 & 0 & 2 \\ D & 0 & 0 & 3 & 0 & 0 \end{pmatrix}$	$\begin{pmatrix} & A \\ a & 1 \\ b & 0 \\ c & 0 \\ d & 4 \\ e & 0 \end{pmatrix}$	$\begin{pmatrix} & A \\ A & 17 \\ B & 0 \\ C & 0 \\ D & 0 \end{pmatrix}$
head	RSparseMatrix	RSparseMatrix	RSparseMatrix

expr	rmat	rmat[[1, All]]	rmat.rmat[[1, All]]
Out[214]= result	$\begin{pmatrix} & a & b & c & d & e \\ A & 1 & 0 & 0 & 4 & 0 \\ B & 0 & 2 & 0 & 0 & 0 \\ C & 0 & 0 & 0 & 0 & 2 \\ D & 0 & 0 & 3 & 0 & 0 \end{pmatrix}$	$\begin{pmatrix} 1 \\ 0 \\ 0 \\ 4 \\ 0 \end{pmatrix}$	$\begin{pmatrix} A & 17 \\ B & 0 \\ C & 0 \\ D & 0 \end{pmatrix}$
head	RSparseMatrix	SparseArray	RSparseMatrix

■ Matrix by matrix

First we look into a dot product to the right of `_RSparseMatrix` with a sparse array and a dot product to the left of `_RSparseMatrix` with a sparse array.

expr	rmat	mat	rmat.Transpose[mat]	Transpose[mat].rmat
Out[216]= result	$\begin{pmatrix} & a & b & c & d & e \\ A & 1 & 0 & 0 & 4 & 0 \\ B & 0 & 2 & 0 & 0 & 0 \\ C & 0 & 0 & 0 & 0 & 2 \\ D & 0 & 0 & 3 & 0 & 0 \end{pmatrix}$	$\begin{pmatrix} 1 & 0 & 0 & 4 & 0 \\ 0 & 2 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 2 \\ 0 & 0 & 3 & 0 & 0 \end{pmatrix}$	$\begin{pmatrix} A & 17 & 0 & 0 & 0 \\ B & 0 & 4 & 0 & 0 \\ C & 0 & 0 & 4 & 0 \\ D & 0 & 0 & 0 & 9 \end{pmatrix}$	$\begin{pmatrix} a & b & c & d & e \\ 1 & 0 & 0 & 4 & 0 \\ 0 & 4 & 0 & 0 & 0 \\ 0 & 0 & 9 & 0 & 0 \\ 4 & 0 & 0 & 16 & 0 \\ 0 & 0 & 0 & 0 & 4 \end{pmatrix}$
head	RSparseMatrix	SparseArray	RSparseMatrix	RSparseMatrix

This creates another `RSparseMatrix` object with no row and column names:

```
In[218]:= rmat2 = ToRSparseMatrix[SparseArray[RandomInteger[{0, 4}, {ColumnsCount[rmat], RowsCount[rmat]}]]];
```

Next we look into two dot products of two `RSparseMatrix` objects.

expr	rmat	rmat2	rmat.rmat2	rmat2.rmat	rmat.rmat2.rmat
Out[219]= result	$\begin{pmatrix} & a & b & c & d & e \\ A & 1 & 0 & 0 & 4 & 0 \\ B & 0 & 2 & 0 & 0 & 0 \\ C & 0 & 0 & 0 & 0 & 2 \\ D & 0 & 0 & 3 & 0 & 0 \end{pmatrix}$	$\begin{pmatrix} 2 & 0 & 4 & 1 \\ 3 & 0 & 4 & 3 \\ 2 & 0 & 1 & 1 \\ 0 & 1 & 4 & 2 \\ 1 & 4 & 4 & 3 \end{pmatrix}$	$\begin{pmatrix} A & 2 & 4 & 20 & 9 \\ B & 6 & 0 & 8 & 6 \\ C & 2 & 8 & 8 & 6 \\ D & 6 & 0 & 3 & 3 \end{pmatrix}$	$\begin{pmatrix} a & b & c & d & e \\ 2 & 0 & 3 & 8 & 8 \\ 3 & 0 & 9 & 12 & 8 \\ 2 & 0 & 3 & 8 & 2 \\ 0 & 2 & 6 & 0 & 8 \\ 1 & 8 & 9 & 4 & 8 \end{pmatrix}$	$\begin{pmatrix} & a & b & c & d & e \\ A & 2 & 8 & 27 & 8 & 40 \\ B & 6 & 0 & 18 & 24 & 16 \\ C & 2 & 16 & 18 & 8 & 16 \\ D & 6 & 0 & 9 & 24 & 6 \end{pmatrix}$
head	RSparseMatrix	RSparseMatrix	RSparseMatrix	RSparseMatrix	RSparseMatrix

Here Associations “swallows” the second value “U” because they are the same. (This is a bug.)

```
In[221]:= DimensionNames[rmat.Transpose[rmat]]
```

```
Out[221]= { U }
```

■ Arithmetic operations

The first three tables in this sub-section should be self-explanatory.

	expr	rmat + 1	rmat - 2	rmat 10	10 rmat + 2.33 rmat

■ Part

A major useful feature is to have `Part` work with row and column names. The implementation of that additional functionality for `Part` is demonstrated below.

In the cases when the dimension drops sparse arrays or numbers are returned. In R the operation “[`“` has the parameter “drop” -- the expression “`smat[1,,drop=F]`” is going to be a spare matrix, the expression “`smat[1,,drop=T]`” is going to be a dense vector. The corresponding implementation is to have the option “Drop→True|False” for `Part`, but that does not seem a good idea.

In the tables with examples below the last rows show the heads of the results.

■ Single row or column retrieval

■ RowBind, ColumnBind

Row and column binding are useful in various data analysis scenarios.

When using row and column names there are couple of questions to be answered.

1. How duplication of row (column) names is handled?
2. How can we specify to ignore the row (column) names when the doing the binding?

```
In[243]:= rmat2 = ToRSparseMatrix[rmat, "RowNames" → Map["s." <> # &, RowNames[rmat]]];
```

```
In[244]:= rmat3 = ToRSparseMatrix[rmat, "ColumnNames" → Map["t." <> # &, ColumnNames[rmat]]];
```

```
In[245]:= ResultsGrid[Inactive[{rmat, rmat2, rmat3}], Dividers → All]
```

```

In[73]:= smat = SparseArray[RandomReal[{0, 1}, {1000, 120}]];

```

Neat example

Consider this incidence matrix, `rBiMat0`, that represents a bi-partite graph of actors starring in movies relationships:

We can use a `RSparseMatrix` object of it with named rows and columns (`rBiMat01`).

If we want to see which actors have participated in movies together with Orlando Bloom we can do the following:

```
In[392]:= Magnify[#, 0.7] &@MatrixForm[rBiMat01.rBiMat01[[All, {"Orlando Bloom"}]]]
```

Out[392]=

	Orlando Bloom
